User guide

Copilot for one-time setup, the Bohio agent for day-to-day work
on EstateMaster

30 SEPTEMBER 2026

This guide does not rely on the EstateMaster manual. Steps marked “confirm first” depend on how EstateMaster behaves and have not been tested: check them in the trial and with Altus.

How it works

- EstateMaster only takes new numbers and gives results through Excel, so two Excel files sit around each model: the **control workbook** (inputs in) and the **export** (results out).
- The **Copilot setup agent** prepares the control workbook once per model, with an analyst checking it.
- The **Bohio agent** does everything after that: proposals, approvals, writing approved values, runs, reports, email scans and memory.
- The AI never edits Excel itself. A small program on the runner machine writes the approved values, exactly, and logs the old value.

Part A. One-time setup for each model

Who: an analyst with Excel and Microsoft 365 Copilot. **Time:** about 1 hour.

1. **Export the model's inputs.** In EstateMaster use Office Links → Excel on the Input sheets. Save the file in the agreed SharePoint folder.
2. **Open the Copilot setup agent in Excel.** Give it the export from step 1 and the KINAN control workbook template.
3. **Ask it to match the model to the template**, for example: "For each row in the export, find the matching line in the control workbook and fill it in. List anything you cannot match."
4. **Review every match.** Put Y in column H for each line you agree with, N/A for lines the project does not use. Check totals against the export (total cost, GFA, land price). Nothing is final until you have checked it.
5. **Save the control workbook** in the SharePoint folder as `ProjectName_control.xlsx`.
6. **Link it to the model in EstateMaster** confirm first On the KINAN master template this is already linked: skip this step. For a legacy model, link the input cells to the control workbook once, using Office Links.
7. **Connect it in the Bohio app.** Model data → Connect control workbook. The app checks every line (errors block, warnings need a look) and raises a change request; a second person approves it. Bohio adds the model to the runner.
8. **Run one test.** Ask for a small change (for example construction cost +1%), approve it, and check that the IRR in EstateMaster matches the agent's report.

Setup is complete once step 8 passes.

Part B. Day to day with the Bohio agent

1. Ask (chat or WhatsApp)

- "What if construction cost goes up 10%?"
- "Stress test the base case."
- "What land price gives a 20% IRR?"
- "Compare our rents with the market."
- "Build the monthly project report."

2. Review the proposal

The agent shows the change, the reason and the estimated effect. Anything that would change EstateMaster becomes a change request (CR-xxx).

3. Approve

In the Approvals tab, in chat, or on WhatsApp (“APPROVE CR-103”). Nothing reaches EstateMaster without it. Promoting a change to the live model needs an Investment Director.

4. The agent runs it

It writes the approved values to the control workbook; the runner makes EstateMaster refresh, recalculate and export; the agent reads the results. confirm first The approval card then shows EstateMaster’s IRR next to the agent’s estimate. If the automation fails or the runner is in manual mode, the card shows a one-minute task instead (open the model, press Refresh, press Export); do it, then press **Collect EstateMaster results**.

5. Any assumption, any scenario

- **Every assumption:** Model data → Model lines lists every input in the model (no limit), searchable. Change one there or in chat (“set pharmacy rent to 2,900”): it becomes a change request, and EstateMaster calculates the effect once approved. There is no instant estimate for these lines.
- **Unlimited stress scenarios:** Stress tests → Scenario generator. Pick a theme and press Generate as often as you like, or describe a scenario in words. Then press **Check worst 5 in EstateMaster**: they run on a scratch copy, so the model does not change.
- **Reports:** Stress report (or ask for the stress test report) covers generated scenarios, EstateMaster’s results and changed lines. Any report can be exported to PDF, Excel or HTML.
- **New model:** “start a new model for plot MLQ-0109”. Once approved, the runner creates it in EstateMaster from the KINAN master template.
- **Live model:** “promote scenario”. Once an Investment Director approves, the runner backs up the live model, writes the values and saves it.

6. Which numbers to trust

The returns on screen, stress tests and sensitivities are the agent’s **estimates**, and are labelled so. EstateMaster’s own figures appear under the returns, on each change request and in reports’ EstateMaster column. Press **Check in EstateMaster** before quoting a figure; if they differ, EstateMaster’s figure stands.

7. Things that run themselves

- **Outlook scans** at 06:00, 10:00, 14:00 and 18:00 (Riyadh): any assumption change found in an email is proposed with the quote it came from.
- **Suggestions** from market comps, actuals, achieved sales, the cost library and zoning.
- **Reports** scheduled or on request, showing the agent’s estimates and, in a separate column, EstateMaster’s own figures; new report types can be added in the report builder.
- **Memory:** every change, proposal, approval and rejection, by a person or the agent, is logged with who, when, channel and the IRR after. Export the log to Excel from the app.

Who does what

TASK	COPILOT	BOHIO AGENT	PERSON
Fill the control workbook for a new model	Suggests		Reviews and saves
Link the workbook in EstateMaster			Once (skipped on the template)
Propose changes, stress tests, suggestions		Yes	
Approve any change			Always
Write approved values to the workbook		Yes (runner)	
Refresh, recalculate, export		Yes (runner), or a person	

Calculations that count	Estimates only	EstateMaster
Create a model in EstateMaster	Yes (runner, from a template)	Approves
Update the live model	Yes (runner, after a backup)	Investment Director approves
Reports, email scans, memory	Yes	Reviews

Rules of thumb

- Never type into the control workbook by hand once a model is live, or the agent's log and the model will disagree. Make changes through the agent, or log them as a manual change.
- If a run fails, the agent stops and tells you. It never reports a number it did not read from EstateMaster.
- Keep one EstateMaster version on the runner machine. Re-run the trial check after any Altus update.

To confirm before rollout

- In the trial, the Refresh and Excel export sequence works without a person (see the setup guide, phase 3).
- Altus allows unattended, automated use under KINAN's licence.
- A Copilot licence and a SharePoint folder are available for the analysts doing setup.
- A copied model keeps its Excel links.
